Published 2008 In part one of this series, Moore (2004a) introduced the general principles of stream gauging by salt dilution. In subsequent articles, Moore (2004b, 2005) described techniques of constant-rate injection and slug injection using salt in solution. This is the final article in the series and details the “mass balance method.”

Slug Injection Using Salt in Solution

The salt dilution (gulp injection) technique is a well established and widely used technique to measure stream discharge, flow velocity and water residence characteristics in small headwater streams. However, the impact of the technique on water quality and instream ecology has been largely ignored in field investigations.

The excel file provides data for a dilution gauging measurement conducted on April 9, 2009. 92 g of Sodium Bromide was added to 18.4 liters of water to create a tracer solution. Once dissolved, the tracer was dumped into the stream approximately 50 m upstream of a monitoring location where electrical conductivity was measured once every three seconds.
