Medical modeling, sometimes called biomodeling, is the creation of highly accurate physical models of human anatomy directly from medical scan data. The process involves capturing human anatomy data, processing the data to isolate individual tissue or organs, optimizing the data for the technology to be used, and finally building the model using Rapid Prototyping [“RP”] techniques.

The medical model of mental illness treats mental disorders in the same way as a broken arm, i.e. there is thought to be a physical cause. This model has been adopted by psychiatrists rather than psychologists. Supporters of the medical model consequently consider symptoms to be outward signs of the inner physical disorder and believe that if symptoms are grouped together and classified into a ‘syndrome’ the true cause can eventually be discovered and appropriate physical treatment ...

Medical applications Surgical uses of 3D printing-centric therapies have a history beginning in the mid-1990s with anatomical modeling for bony reconstructive surgery planning. By practicing on a tactile model before surgery, surgeons were more prepared and patients received better care.

Applications of 3D printing - Wikipedia

Computational modeling is the use of computers to simulate and study complex systems using mathematics, physics and computer science. A computational model contains numerous variables that characterize the system being studied. Simulation is done by adjusting the variables alone or in combination and observing the outcomes.
