Monomotronic Function

In mathematics, a monotonic function (or monotone function) is a function between ordered sets that preserves or reverses the given order. This concept first arose in calculus, and was later generalized to the more abstract setting of order theory.

Monotonic function - Wikipedia

Monotonic function. A monotonic function is a function which is either entirely nonincreasing or nondecreasing. A function is monotonic if its first derivative (which need not be continuous) does not change sign. The term monotonic may also be used to describe set functions which map subsets of the domain to non-decreasing values of the codomain. In particular, if *f* is a set function from a ...

Definition. A function *f* is called monotonic on an interval *I* if it is either increasing or decreasing on *I*. Theorem. Suppose *f* is continuous on [*a*, *b*] and differentiable on (*a*, *b*). (1) If *f*' (*x*) > 0 for all *x* in (*a*, *b*), then *f* is increasing on (*a*, *b*).

What does monotonic function mean?

A function is said to be monotonically increasing (or non-decreasing) if its values are only rising and never falling with increasing values of (*x*). Likewise, it is said to be monotonically decreasing (or non-increasing) if its values are only falling and never rising (*x*). It is strictly increasing if values always become larger and cannot be constant (*x*).

5.3 Monotonic Functions

Monotonic Function (or monotone function), a function whose increments $\Delta f(x) = f(x') - f(x)$ do not change sign when $\Delta x = x' - x > 0$; that is, the increments are either always nonnegative or always nonpositive. Somewhat inaccurately, a monotonic function can be defined as a function that always varies in the same direction.
