The Stock Power Cord Is The "Bottle Neck". Electric power travels from the power station through high-voltage transmission lines. The idea behind high-voltage transmission is minimal current flow as energy is carried very efficiently via coaxial cable in a magnetic field. A single transmission line typically carries enough power for multiple homes or businesses, and can be thought of as an "energy resevoir".

Design technologies. The purpose of submarine power cables is the transport of electric current at high voltage. The electric core is a concentric assembly of inner conductor, electric insulation and protective layers (resembling the design of a coaxial cable). Modern three-core cables (e.g. for the connection of offshore wind turbines) often carry optical fibers for data transmission or temperature measurement, in addition to the electrical conductors.

Audio power cables are important because the power supplies in your audio electronics are very "short-sighted." By this, we mean that they are most strongly influenced by what is connected very close to them in the circuit, such as the electrical power cables. So think of the AC power cord as an extension of the power supply.
